Fit risoluzione in p_T vs $|\eta^{truth}|$: r_0 libero vs $r_0 = 0$

$\sigma_{p_T}/p_T = \sqrt{r_0^2/p_T^2 + r_1^2 + (r_2 \times p_T)^2}$ -- tutti i sample combinati (Z + Z')

In rosso: χ^2/ndf > 3, fit poco affidabile

In blu: r_2, la risoluzione nominale ATLAS ad alto p_T
